

TRUE

UTV-SBI-15CK

Summary

The new True UTV-SBI-15CK is the only product specifically designed to deal with the unique attributes of the stator charging systems in all UTV, motorcycle, and ATVs. Featuring "The 15"; our newest, completely redesigned Smart Battery Isolator is specifically programmed to handle the difficult process of efficient management of the high fluctuation of available charging amps. This unit will allow the addition of a second battery of any type or size to be added to the factory unit without modification of the charging system or wiring. It does not require connection to the ignition or directly to the stator. With the True UTV-SBI-15CK operators can quickly and easily add that second battery to properly power the winch, light bars, stereos, coolers and more.

Comparison

Our automatic system will totally eliminate the possibility of draining both batteries by using more power than your stator is producing even when your engine is running. Standard manual switches or ignition activated solenoids can and will leave you stranded due to this occurrence. Not to mention the destruction of the your battery's reserve capacity. Most other automated switching system are less than 80% efficient while "The 15" reaches a 98% efficiency in making full use of the available amps. The True UTV-SBI-15CK saves money and provide peace of mind. Tested in both commercial and recreational use the UTV-SBI-15 kits have no real comparisons.

Cross Reference

The True UTV-SBI-15CK is an upgrade replacement for all Polaris Dual Battery Kits as well as being applicable to all other 12 volt UTV, ATV and similar type vehicles equipped with stator charging mechanisms.
